

How to use these token cutouts

These pages contain the text *The Cat in the Hat* by Dr Seuss. The **red text** above each token shows its prefix—the 2 words before it in the original text.

Training: build the cutouts model

1. **cut out the tokens** from the sheets above along the dotted lines (carefully—keep each prefix-token pair together)
2. **spread them out** on a table, face up, no overlap if possible
3. that's your trained language model—every prefix-token pair from your training text is now a physical cutout on the table

Optional extension: once you've got the hang of it, group the cutouts into piles by their **red prefix label**. Each pile is a “bucket” in computer-science speak—the same trick a hash table uses to find values quickly.

Generation: sample new text

1. **choose a starting prefix**—any word that appears as a **red label** on at least one cutout
2. **write it down**, then make it your “current word”
3. **find candidates**—look across the spread for cutouts whose red prefix label matches your current word
4. **pick one** visually (your eye will land on cutouts more often when there are more of them—that's weighted sampling for free)
5. **write down** the picked cutout's token, then **put it back** in the spread
6. the token you just wrote is your new current word—go back to step 3

Tip: if a prefix has more cutouts in the spread, words following it are more common in the source text, and your eye will pick them more often.

Model statistics

- **Total tokens:** 1832 (1832 kept)
- **Entropy:** 0.8 bits/token — how unpredictable each pick is
- **Perplexity:** 1.7 — effective number of choices per pick

104

105

106

went bump how that bump made us

107

108

109

110

111

made us jump we looked then we
