

Search sheets: how to run the activity

The pages after this one are 24 **search sheets**, built from *The Tale of Peter Rabbit* by Beatrix Potter. Print them one-sided and hand out **one sheet per person** — every sheet is different, and nothing needs cutting out.

Each sheet holds 46–47 **entries**. An entry is a **next word** paired with the **previous word** that came immediately before it somewhere in the original text.

In **thing** **he**, the boxed word is the previous word and *he* is the next word. Every distinct word has its own colour and keeps it wherever it appears, so you can scan by colour first and check the word second — though two unrelated words occasionally share a colour, so always verify the word itself.

1123 tokens, 388 unique · 2.25 bits/token · perplexity 4.8 · branching factor 2.32

Running a round

1. **Call out the last word** of the text so far.
2. Everyone scans their own sheet for entries whose previous word matches. **Hands up** — one hand each, and anyone with more than one match just goes with the first they spot.
3. **Pick a raised hand at random** and ask for that entry's next word.
4. A scribe writes the word on the board. That word becomes part of the context for the next round. Repeat.

Picking at random matters. If you take whoever shouts first you are sampling the fastest reader, not the text — and the whole point is that the room samples the way the model does.

Worked example

Start anywhere. Pick any entry — say this one — and write its previous word *and* its next word on the board.

Round 1. Call out the last word on the board (*he*). Another sheet has a match, so that person raises a hand and reads out *ate*.

Round 2. Call out the last word on the board (*ate*). Another sheet has a match, so that person raises a hand and reads out *some*.

Keep going for as long as you like. The text the room writes will sound like *The Tale of Peter Rabbit* without ever repeating it — that is the model generating, not the corpus being read out.

What to watch for

The hands are the probability distribution. Every entry was dealt to exactly one person, and the deal spreads each context across as many people as it will go, so a common continuation really does put more hands in the air than a rare one. Nobody has to explain weighted sampling; the room performs it. (Roughly: for a context more common than the class is big, somebody holds two matches but raises one hand, which flattens the busiest contexts.)

Nobody holds the model. No single sheet can continue the text on its own. The model only exists across the whole room — and if somebody is away, their share of it is missing, and some contexts will draw no hands at all.

Running dry. If no hands go up, you have reached a context that only ever occurred at the very end of the text. Start again from any entry.
